Everything can be tied into our fantastic state-of-the-art Daktronics video displays to create a multimedia experience that your clients will remember. Xcel Energy Center's center-hung video displays are super-bright HD/LED displays with 6mm centers. Pixel spacing is the distance between pixels. The total resolution equals the total number of pixels per display. The smaller pixel distance, the higher the resolution. The main scoreboard also features three-foot high upper and lower HD/LED matrix ribbon displays (6mm centers). An HD/LED high matrix display rings the entire Bremer Bank Suite Level of the arena plus two additional ribbon displays extend the full length of the upper level side fascia. The "crows' nests" in each corner of Xcel Energy Center feature HD/LED displays; and three of the four extend vertically as well. All of these displays are full color and capable of spectacular animation.
